How does this GPT avoid misinformation?

Q: Does this GPT make things up?

A: It is designed to avoid speculation. When evidence is weak, conflicting, or incomplete, it labels uncertainty or declines to give a definitive answer.

Q: How does it decide what's reliable?

A: It prioritizes authoritative sources such as museum publications, archival records, and established maritime historians over popular repetition or unsourced claims.

Q: What about famous ships like Titanic?

A: High-profile ships receive extra scrutiny, as they are especially prone to myth, misattribution, and reproductions.

Q: Will it always give an answer?

A: No. Refusing attribution, valuation, or certainty when evidence is insufficient is an intentional feature, not a failure.

Q: What should users rely on it for?

A: Informed historical context and disciplined analysis—not certification. Important decisions should be corroborated with primary sources or qualified professionals.
